Box No. VII Certain defects in the international application

The following defects in the form or contents of the international application have been noted:

see separate sheet

Box No. VIII Certain observations on the international application

The following observations on the clarity of the claims, description, and drawings or on the question whether the claims are fully supported by the description, are made:

see separate sheet

Re Item I.

- The amendments filed with the demand introduce subject-matter which extends beyond the content of the application as filed (Art. 34(2)(b) PCT).
- 1.1 According to claim 1 the circuit is adapted to detect a voltage <u>change</u> across the sensing resistor. This is not disclosed in the original application, which discloses a circuit adapted to detect if the current is greater or lower than a second or a first threshold, respectively.

Re Item V.

The following documents are referred to in this communication:

D1: US 6 151 649 A (DINH HUNG ET AL) 21 November 2000

D2: US-A-5 920 266 (DIXON GLENN B ET AL) 6 July 1999

- 1 The subject-matter of claim 1 is not new in the sense of Art. 33(2) PCT.
- 1.1 Document D1, discloses (the references in parentheses applying to this document), in terms of claim 1, an electronic circuit, capable of terminating a plurality of conductors at, or near, a node on a network (col. 6, line 1, to col. 7, line 23; fig. 4), comprising:
 - detecting means, operable to detect current in at least one of the plurality of conductors (col. 6, line 1, to col. 7, line 23; fig. 4), and
 - switching means operable to switch the circuit between being a continuing circuit, upon the detecting means detecting current greater than a first predetermined threshold, and being a terminating circuit, upon the detecting means detecting current at, or less than, a second predetermined threshold (col. 7, lines 1-5),

wherein the detecting means comprises:

- a sensing resistor, connected in series with the at least one of the plurality of conductors (col. 8, lines 19-27; fig. 6), and
- means for detecting voltage across the sensing resistor (col. 8, lines 19-27; fig.

6).
Since all features of claim 1 are known in combination from D1, the subject-matter of claim 1 is not new.

- 1.2 The above reasoning about the lack of novelty of the subject-matter of claim 1 can also be based on D2 (col. 3, line 33, to col. 5, line 26).
- The additional features of the dependent claims are either known from D1 (means for detecting voltage being a differential amplifier, switching means comprising a transistor, power supplies operable to provide current flowing in opposing directions) or common measures (impedance matching means comprising a terminating resistor in series with a terminating capacitor, first threshold being the same as second threshold, connections of the transistor).

Re Item VII.

- The features of the claims are not provided with reference signs placed in parentheses (R. 6.2(b) PCT).
- 2 Contrary to the requirements of R. 5.1(a)(ii) PCT, the relevant background art disclosed in D1 is not mentioned in the description, nor is this document identified therein.

Re Item VIII.

Claim 4 is not clear (Art. 6 PCT) because it mentions a single threshold, which is in contradiction with claim 1, on which claim 4 depends. Claim 1 mentions two thresholds.

13, 07, 2005

3

A further object of the present invention is to provide a node comprising such an electronic circuit.

A further object of the present invention is to provide a network comprising a plurality of such circuits.

The present invention provides for an electronic circuit, capable of terminating a plurality of conductors at, or near, a node on a network, comprising detecting means, operable to detect current in at least one of the plurality of conductors, and switching means operable to switch the circuit between being a continuing circuit, upon the detecting means detecting current greater than a first predetermined threshold, and being a terminating circuit, upon the detecting means detecting current at, or less than, a second predetermined threshold, characterised in that the detecting means comprises a sensing resistor, connected in series with the at least one of the plurality of conductors, and means for detecting voltage across the sensing resistor, such that a change in current flowing in the at least one of the plurality of conductors, indicative of a break or fault in a said network, is detected by sensing a change in voltage across the sensing resistor.

The terminating circuit advantageously comprises impedance matching means. The impedance matching means may comprise a terminating resistor connected in series with a terminating capacitor.

The terminating circuit is preferably connected between the at least one of the plurality of conductors and the, or each, of the other conductors.

4

The network may be an active network and the node may be the end node of that active network.

The first threshold may be greater than the second threshold. The means for detecting voltage is preferably a differential amplifier.

The switching means preferably comprises a transistor wherein the base terminal thereof is connected to an output of the detecting means. The collector terminal of the transistor is preferably connected to the impedance matching means and the emitter terminal is preferably connected to the, or each, of the other conductors.

The present invention also provides for a network node comprising an electronic circuit as herein defined in the preceding six paragraphs.

The present invention also provides a network comprising at least one electronic circuit as herein defined in the preceding six paragraphs.

The present invention will now be described by way of example, with reference to the following drawings, in which:

EPO - DG 1

13.07.2005

CLAIMS:

- 1. An electronic circuit, capable of terminating a plurality of conductors at, or near, a node on a network, comprising detecting means, operable to detect current in at least one of the plurality of conductors, and switching means operable to switch the circuit between being a continuing circuit, upon the detecting means detecting current greater than a first predetermined threshold, and being a terminating circuit, upon the detecting means detecting current at, or less than, a second predetermined threshold, characterised in that the detecting means comprises a sensing resistor, connected in series with the at least one of the plurality of conductors, and means for detecting voltage across the sensing resistor, such that a change in current flowing in the at least one of the plurality of conductors, indicative of a break or fault in a said network, is detected by sensing a change in voltage across the sensing resistor.
- 2. An electronic circuit as claimed in Claim 1, wherein the terminating circuit comprises impedance matching means.
- An electronic circuit as claimed in Claim 2, wherein the impedance matching
 means comprises a terminating resistor connected in series with a terminating
 capacitor.

13

- 4. An electronic circuit as claimed in any of the preceding claims wherein the first threshold is the same as the second threshold.
- 5. An electronic circuit as claimed in any of the preceding claims, wherein the means for detecting voltage is a differential amplifier.
- 6. An electronic circuit as claimed in any of the preceding claims wherein the switching means comprises a transistor.
- 7. An electronic circuit as claimed in Claim 6, wherein the transistor comprises a base terminal connected to an output of the detecting means.
- 8. An electronic circuit as claimed in Claims 6 or 7, wherein the transistor comprises a collector terminal, connected to the impedance matching means, and an emitter terminal connected to the, or each, of the other conductors.
- 9. A node comprising an electronic circuit as claimed in any of the preceding claims.
- 10. A node as claimed in Claim 9, further comprising checking means operable, upon the detecting means detecting current at, or less than, the second predetermined threshold, to check the status of the conductors connected to an adjacent node.

14

- 11. A network comprising at least one electronic circuit as claimed in any of the preceding claims.
- 12. A network as claimed in Claim 11, comprising a plurality of power supplies operable to provide current flowing in opposing directions through the network.
